SLURRY MANAGEMENT SYSTEM
PHYSICOCHEMICAL REACTOR

Physicochemical Reactor (*):
Patend System.

(*) Check price.

The **Physicochemical reactor** has a first coagulation chamber with fast agitation. The separated liquid enters this chamber where it is acidified and the chemical coagulants are added.

Then the flocculation phase takes place in a second chamber, with slow agitation.

Lastly, the system has a slowing-down chamber that improves the grouping and compacting of the solids, so that the filtration sieve can separate the flocculated solid.
